

Ansible Training

Created by Antoine Barbare ([@antoine_geek](#))

Agenda

- Couple of exercices
- Hands on Ansible
 - Deploy system pre-requisites
 - Deploy application on remote system
- Advanced use of Ansible
 - Templating
 - Variable usage

Technical environment

- 1 Ansible bastion
- 1 VM per user
- Access through SSH via login/password

VM will be destroyed tonight. Code will be available on Github

Get your account

https://huit.re/devops_lille_ansible

Try your access to Ansible Bastion

```
user@laptop:~# ssh ansible<user_number>@ansible.barbare.me
```

Make sure you have access to your VM

```
ansible01@ansible:~# ssh ansible@ansible<user_number>
```

Create your inventory file

Based on your user number, create your inventory file.

You can take example on `/etc/ansible/hosts`

Test your inventory file:

```
ansible01@ansible:~# ansible -i inventory all -m ping -b  
master | SUCCESS => {  
    "changed": false,  
    "ping": "pong"  
}
```

`-b` option will check the ability to switch root through
`sudo`

Deploying a simple app

We want to deploy devops web application on our VMs

Deploying a simple app

Simple HTML landing page
Served via Nginx Web Server

#TODO

- Create a role to install Nginx web server
- Create a role to deliver our application
- Wrap up roles in a playbook
- Deliver on our server

Nginx role

Create your first role and playbook

- Install Nginx on the server
- Start and Enable Nginx at boot
- Wrap up your the role in a playbook

```
[ansible01@ansible ~]$ tree
```

```
.  
├── inventory  
├── playbook.yml  
└── roles  
    ├── nginx_install  
    │   └── tasks  
    │       └── main.yml
```

Try: `ansible-playbook -i inventory playbook.yml`

Solution

```
#roles/nginx_install/tasks/main.yml
---
- name: Install nginx daemon
  yum:
    name: nginx
    state: present
    update_cache: yes

- name: Start nginx and enable it at boot
  systemd:
    name: nginx
    state: started
    enabled: yes
```

Solution

```
#playbook.yml
---
- name: Deploy devops app
  hosts: all
  become: yes
  roles:
    - nginx_install
```

Check thaht nginx is installed and available

```
curl ansible<user_number>.barbare.me
```

Deploy app role

Update your roles and playbook

```
[ansible01@ansible ~]$ tree
```

```
.
├── inventory
├── playbook.yml
└── roles
    ├── deploy_app
    │   ├── files
    │   │   ├── nginx.conf
    │   │   └── nginx-devops.conf
    │   ├── handlers
    │   │   └── main.yml
    │   └── tasks
    │       └── main.yml
    └── nginx_install
        └── tasks
            └── main.yml
```

Deploying application

Devops App resources are available online:

- <https://github.com/antoineHC/ansible-meetup-app>
- <https://github.com/antoineHC/ansible-meetup-nginx>

ansible-meetup-app =>

```
/usr/share/nginx/html/ansible-meetup-app/
```

```
nginx.conf => /etc/nginx/nginx.conf
```

```
nginx-devops.conf => /etc/nginx/conf.d/app.conf
```

Don't forget to restart nginx after deploy your app

Solution

```
#roles/deploy_app/tasks/main.yml
---
- name: deploy devops app from github
  git:
    repo: https://github.com/antoineHC/ansible-meetup-app
    dest: /usr/share/nginx/html/ansible-meetup-app

- name: update nginx conf
  copy:
    src: nginx.conf
    dest: /etc/nginx/nginx.conf
  notify: restart nginx

- name: update nginx devops conf
  copy:
    src: nginx-devops.conf
    dest: /etc/nginx/conf.d/devops.conf
  notify: restart nginx
```

Solution

```
#roles/deploy_app/handlers/main.yml
```

```
---
```

```
- name: restart nginx
  systemd:
    name: nginx
    state: restarted
  listen: restart nginx
```

```
#playbook.yml
```

```
---
```

```
- name: Deploy devops app
  hosts: all
  become: yes
  roles:
    - nginx_install
    - deploy_app
```

Check our your app online

Success !
